S7 ⬡ Systemline

S7 is an installed multi-room music system which has been exclusively engineered to achieve two distinct design goals. These are: to discreetly complement the elegance of your home, whilst simultaneously enhancing your musical listening enjoyment.

There are no visibly intrusive boxes or trailing mains leads because everything is hidden out of sight. You simply enjoy true hi-fi stereo sound from the S7's high quality, low-profile ceiling speakers.

Any choice of music can be enjoyed in any room. Or if you prefer, play the same music in all rooms or even create a group or groups of rooms where your music can be shared. Listen to what you want, when you want and where you want.

It's as easy as '1'

'One Touch' operation makes using S7 as easy as can be. Instantly select from any stored favourites: these can be playlists, albums or radio stations.

Optional TV sound integration

S7 can automatically switch between music and TV sound. You can even use a number of handsets, including Sky models, to directly control S7. The experience is completely seamless.

Automation

S7 can fully integrate with Building Management and automation control systems. **Please enquire for further details.**

Tailor Systemline 7 to suit your lifestyle

Epitomising seamless integration, Systemline S7 switches automatically between music, home cinema and TV sound. It can even be controlled from a 'Sky' handset.

up to 5.1

Nobody wants clutter in their kitchen, so an 8" in-wall TouchPanel would be a good choice.

An ideal choice for control in a guest bedroom would be an in-wall keypad, which offers 'one touch' selection of favourites.

For an outdoor garden/patio/pool area, the AirPlay feature built into the S7 Netmusic App, could be used to stream to a battery powered AirPlay enabled speaker. Alternatively, outdoor speakers could be installed in multiple locations, controlled by a weatherproof keypad or via a mobile device.

Discreet 4" TouchPanels are a nice option for bedrooms.

A simple keypad in the en-suite makes it really easy to share whatever music or TV program that's playing in the master bedroom.

Of course, all rooms can simply be controlled by a mobile device such as an iPhone or iPad.

Audio File Formats

There are various types of file formats for storing music. Some are compressed and usually 'lossy', which means that content has been removed to reduce the size of the files. MP3 is the best known lossy file format and is available with a number of different levels of compression. Lossless file formats such as FLAC (Free Lossless Audio Codec) are designed to capture the entire content and are also available with different levels of resolution. CD for example is 16bit/44kHz, whereas Studio Quality is typically 24bit/96kHz. The highest resolution generally available is 24 bit/ 192 kHz.

Systemline S7 supports all these file formats.

Behind the scenes

NetServer   Music storage and access to internet services
NetAmp*   Hi-Fi amplification & control

The heart of the system is the NetServer and one or more NetAmps, but you won't see them because they will be neatly hidden away in a purpose designed enclosure.

The NetServer is the repository for all your stored music files (up to 24bit/192kHz). It boasts a capacity of more than a million tracks and is the gateway for all the supported internet services. The NetServer also supports automatic CD ripping & album art detection in addition to the transfer of existing electronic music files over the network. iTunes is supported with the recommendation that the iTunes library is mirrored to the NetServer hard drive.

The NetAmp connects to the NetServer via a Direct Digital connection and provides stereo hi-fi amplification and control for each room. One NetAmp services two rooms and Systemline S7 can support up to 24 fully independent rooms

Higher power, higher performance Systemline amplifiers can be added to the system to provide even better hi-fi performance for selected rooms.

Important Note: Even the best wireless systems suffer drop-outs and ultimately limit sound quality, due to bandwidth constraints. Only wired systems such as Systemline S7 can be used without compromise, because we only use the Wi-Fi network for control, not for audio distribution.

*NetAmp Plus should be specified for 'bit perfect' 24bit/192kHz resolution.

Integration with: CRESTRON   Control4   LUTRON

LOXONE   FIBARO   RTI   DEMOPAD

Full control of everything: via a simple to use, but incredibly powerful App.

The NetMusic App

The world is your oyster in terms of the choice of music available. Your own music collection is stored on a hard drive built-in to the Systemline NetServer. Internet radio is available from a number of providers including the popular 'Tune-in' and 'BBC iPlayer', which supports both live radio and a full 7 day catch-up service. Add to this, music-on demand services such as 'Spotify' 'Deezer', and 'Qobuz' and more, means you can explore the whole world of music from the comfort of your own home.

S7 also adds a social element to your musical enjoyment with its integrated support of Facebook and Safari. You can chat to your friends, check the weather or latest news, all without having to jump in and out of separate Apps.
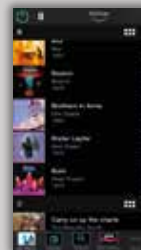

A selection of the services available

iPad Homescreen

iPad Navigation screen

iPhone Navigation screen

iPhone Now playing screen

The S7 product family

NetServer

Repository for stored music and gateway to all internet services.
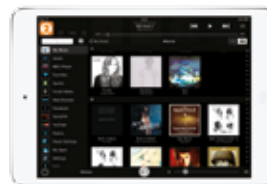

NetAmp

2-Zone Smart Amp 2 x 40 Watt RMS into 4 Ohms.

NetPower

2 x 100 watt RMS into 4 ohms.

NetMusic App

Lightning fast and comprehensive music App (requires iOS7 or later)

Local Input Module

Connects to the digital output of a TV and supports Sky handset control.

In-Wall TouchPanels

4" & 8" auto dim one touch operation.

In-Wall KeyPads

Simple one touch 3 button and 11 button keypads.

Systemline was the first electronics company in Europe to enter the installed multi-room music system market way back in 1988, and have been responsible for a number of world firsts. The heritage of the brand comes from the specialist Hi-Fi sector and the first Systemline amplifier was derived from the 1986 What Hi-Fi? award winning QED A240 amplifier.
